CARE & HANDLING

Storage

Galvanized steel sheets have a good service life when exposed to normal weather conditions. However, these sheets are subject to stain when water sits upon or becomes trapped between the sheets.

If galvanized sheet are to be stored for any period of time, they should be unbundled and stood on end against an interior wall. Metal should be spread or fanned out at their bottom ends to allow for air circulation and should be off the ground on blocks. If storage is to be for a day or two, keep the metal inside inside in the bundle up off the ground on blocks. Never cover the material with plastic as this promotes sweating. Failure to follow these steps may result in wet storage stain and premature white rusting, which the manufacturer cannot be held responsible for.

Cutting

When using a power saw to cut metal panels several precautions should be taken. Place the bottom {interior} surface of the sheets up and cover with a tarp to protect the top {exterior} surface from the hot metal filings and reduce the chance of damage. When doing the actual cutting, be sure to wear protective eye glasses and do it away from other unused or applied panels. Metal filings may become embedded in the surface of the sheet and if left alone will quickly rust. Be sure to wipe all filling from both surfaces before application

RETURNS

There will be no Returns Accepted without a Return Memo and there will a 45% Restocking charge. Material must be wrapped and in saleable condition

No Returns after 60 days. Job cut steel will not be available to Return.

SNAP Lock Roof Maintenance

- Check roof penetrations for possible leaks. Leaks most often come from heat or air vents and skylights. Some leaks are caused by the shrinking or hardening of applied silicones as they dry out. If there is a crack or a suspected area, fill it using a Metal Roofing Sealant which is permanently flexible and won't crack.

- Inspect areas around chimneys, heat vents, oil condensers above cooking areas and air conditioners, these areas can expose your roofing to chemicals that will break down the paint system and can corrode the metal.

- Look for loose flashing, roof sheets, fasteners, or punctures from falling objects.

- Inspect your roof paint for scratches. Should this occur, clean the area with mineral spirits, rinse completely with water and allow to dry. Using paint supplied from the manufacturer of the panel apply a minimum amount of paint to cover the scratched area. This may need to be touched up again in several years.

If exposed fasteners have been used on your roof, it is imperative that they are inspected annually. The inspection entails several key points:

- Are the fasteners installed correctly? Sometimes fasteners are tightened down too much which may cause them to cut or split the neoprene washer.

- Other fasteners may not be tightened properly which will not create a seal between the fastener and the metal panel or flashing.

- Neoprene washers may break down over time due to expansion and contracting of metal panels or from exposure to ultraviolet rays. By rubbing your fingernail over the washer you will notice if it is still flexible or has hardened and is breaking apart.

Finally, look at the closures or venting materials under the ridge caps, transitions, end walls and valleys. At times this material can come loose or break down from sun exposure and cause leaks. Replace as necessary.

Preparing to Install Your New Roofing

Northland Steel & Trim quality light gauge material can be used for new or existing structures.

Prepping New Construction

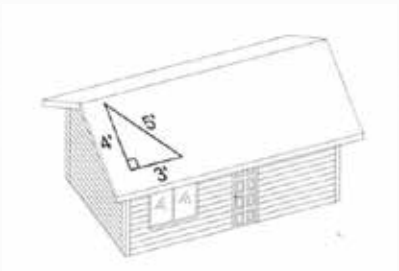
1. If you need openings cut for venting through the ridge or plumbing vents or electrical conduits, now is the time to add them before panel installation.

2. It is very important to check for protruding nails and other objects which may puncture the underlayment and roofing panels. Be sure to clean all foreign materials from the roof.

3. Cover the deck with a moisture barrier such as a minimum 30 # pound felt or other approved underlayment. Begin at the eave and roll the underlayment horizontally (along the eave). Overlap the next strip at least 3 inches.
   (Place a hi-temp & water membrane underlayment in areas which snow, ice, and rain can accumulate, such as valleys and eaves,. This will be applied to the roof before rolling the 30 # pound felt out).

4. Place an alignment line along the gable end where the first panel will be installed. This line must be parallel to the gable edge of the roof and square with the eave edge. Check the roof for squareness by making a 3 foot line across the eave. (see illustration)
   Completing the 3' x 4' x 5' triangle should place the 4' line parallel along the gable edge. The first panel will be placed along this line. Any out of square conditions up to 3" can be covered by the gable trim.

It is important to measure the roof from gable to gable. Proper placement of panels will allow the panel ribs on each side to be covered by the gable trim while creating a symmetrical appearance on the roof.



Re-roofing Existing Structures

It is best if existing roofing such as shingles, cedar shakes be removed so there is a smooth substrate for installing metal roofing panels. Metal roofing should never be installed over an uneven surface.

Another good reason for stripping a roof is to look for any defects which need repair or replacements.

Never apply metal roofing over a damaged substrate.

If you are going to strip the roof go back to new roof installation.

If you do decide to apply over existing roofing, inspect the roof for defects and repair so the new roofing has a flat surface to be applied to.

1. Secure or remove any wrapped roofing.

2. Make sure there are no protruding nails or other objects which may affect the new underlayment or roofing panels.

3. Remove all moss and other debris.

4. Remove all hip cap, ridge cap, and penetration flashing.

5. Cover the deck with a moisture barrier such as a minimum 30 # pound felt or other approved underlayment. Begin at the eave and roll the underlayment horizontally (along the eave). Overlap the next strip at least 3 inches. (Place a hi-temp & water membrane underlayment in areas which snow, ice, and rain can accumulate, such as valleys and eaves. This will be applied to the roof before rolling the 30 # pound felt out).

6. Place an alignment line along the gable end where the first panel will be installed. This line must be parallel to the gable edge of the roof and square with the eave edge. Check the roof for squareness by making a 3 foot line across the eave. (see illustration)
   Completing the 3' x 4' x 5' triangle should place the 4' line parallel along the gable edge. The first panel will be placed along this line. Any out of square conditions up to 3" can be covered by the gable trim.

It is important to measure the roof from gable to gable. Proper placement of panels will allow the panel ribs on each side to be covered by the gable trim while creating a symmetrical appearance on the roof.

Panel Installation

Study the trim details in this manual before installing the panels. Pay close attention to valleys, eaves, and transitions.

Follow these basic guidelines:

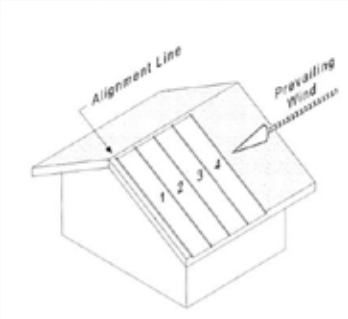
1. Install eave trim and valley trim prior to panel installation.

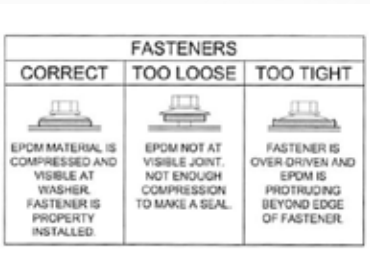
2. Always install your panels into the prevailing wind.

3. Align the edge of the first panel with the alignment line constructed along the gable end. Allow the panel to overhang the eave 1" to 2".
   (If venting through the ridge make sure you hold the underlayment down 2" from the ridge. Also make sure your decking is 2" down from the top of the ridge on both sides. Doing this will allow for air circulation in the attic space.)

4. After the first panel is properly aligned, fasten per the fasteners placement and spacing guide.
   A) Lay down second and third panels, check the alignment, and be sure they are square. You may have to stretch or shrink the panel by either pulling the top or bottom of the panel to make up the distance needed to be square. If you have over a 1/4" to make up it is best to stretch or shrink the panel over the next few panels.

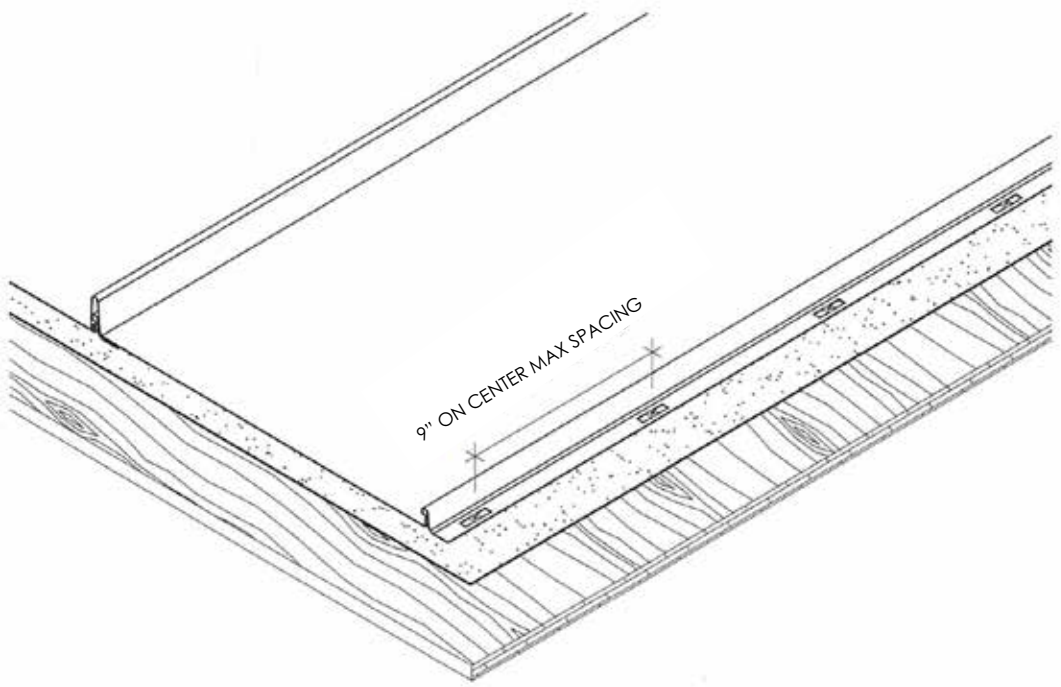
5. After the panel are installed, you can install the rest of your trim and flashing. Start at the eave edges and work your way up. For example, place your gable trim starting at the bottom edge and work towards the ridge. If pieces must be overlapped: a 2" minimum is recommended. Once the gable trim is installed, you may then install the ridge cap. Please see trim details on how each piece of trim is to be handled.





Fastener Installation

Screw fasteners have been proven to have 2 to 3 times the holding power of nails. For maximum holding power, it is recommended that the minimum wood penetration be 1 inch. Utilizing pancake head screw fasteners have an excellent quality and are specifically designed for fastening clips to the metal roofing panels. For OSB and plywood ½" or less, use #14 x 1" wood screws.



All testing based on 24ga material

To prevent damage to panels and trim, install immediately or store in a cool dry area. Carbonized steel, galvanized steel, Aluminized steel, galvalume and all alloys of aluminum are susceptible to what is commonly referred to as "white" or "black" rust and water stain. These are caused by electrolysis, which occurs when moisture exists between stacked sheets. Painted metal products are also susceptible to a change of or loss of paint gloss discoloration, delaminating, disintegrating, and other accelerated defects of the paint as a result of moisture between the panels sheets. **Northland Steel and Trim assume no responsibility of liability for damage to our product which occur in the possession of the consignee or which we deem to be improper handling and storage.** If panels are to be cut or drilled, be certain to wipe free any metal filings that may have accumulated. Protective plastic film on the trim should be removed within 90 days. **Failure to follow these instructions may void the warranty.**

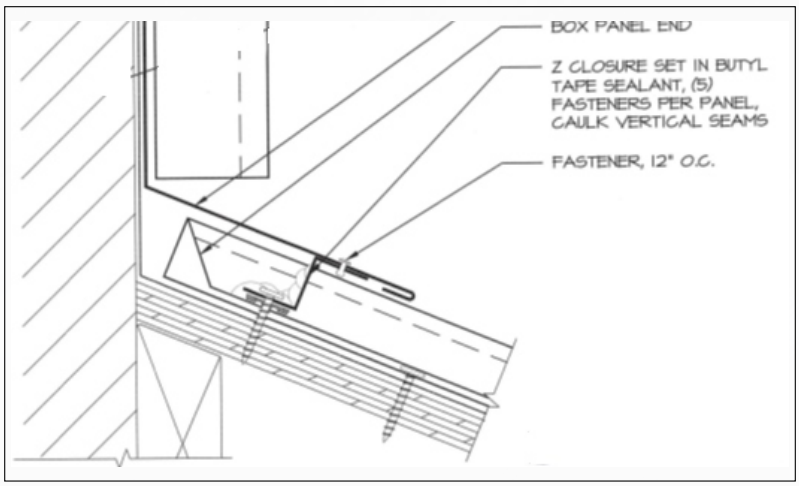
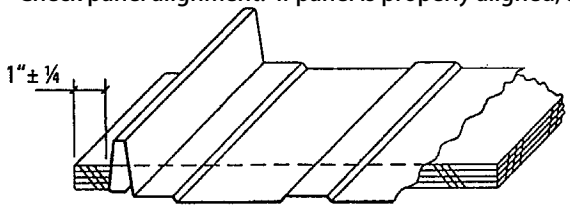
Endwall Flashing

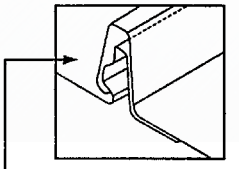


Classic Snap Lock 16″

Installation Steps

1. Snap a chalk line 1″ from rake edge of the roof.
2. Align the female edge of the first panel with the chalk line.
   The panel should overhang the eave as required by the selected eave detail.
3. Check panel alignment. If panel is properly aligned, attach rake with a #10 x 1″ hi-low woodscrew at 24″ centers.

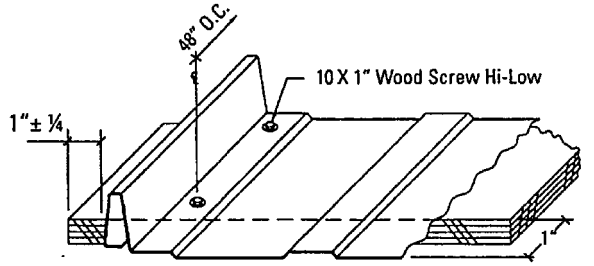




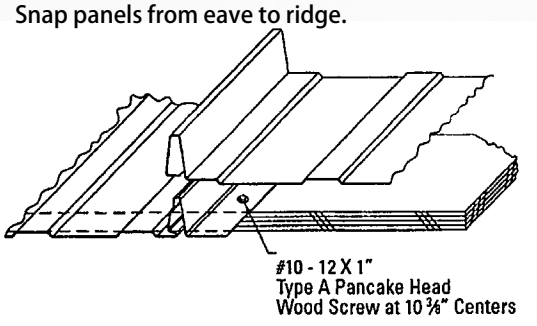
PANEL END DETAIL

FILL END WITH TUBE CAULK

4. Attach the extended nail strip leg of the first panel to the plywood substrate with a #10 x 1″ pancake head fasteners at 9″ centers (alternate slots).



5. Align the second panel female edge with the starter panel male edge.
   Panels must be flush at eave edge then lightly compress and snap panels together at seam.
   Snap panels from eave to ridge.



WS10 - 1" Wafer Screw
WS11 - 1-1/2" Wafer Screw

6. After panel seam is locked, fasten the panel with a #10 x 1″ type A pancake head wood screw along the male leg at 9″ on center slot.
7. Continue to apply panels as shown in the previous steps.
8. To terminate panels - fasten along the eave with a #10-11cupped truss head wood grip with washer. Fasten along a line parallel to the eave edge 2″ up from the eave edge. The fasteners are spaced at 3″ centers.

Northland Steel & Trim

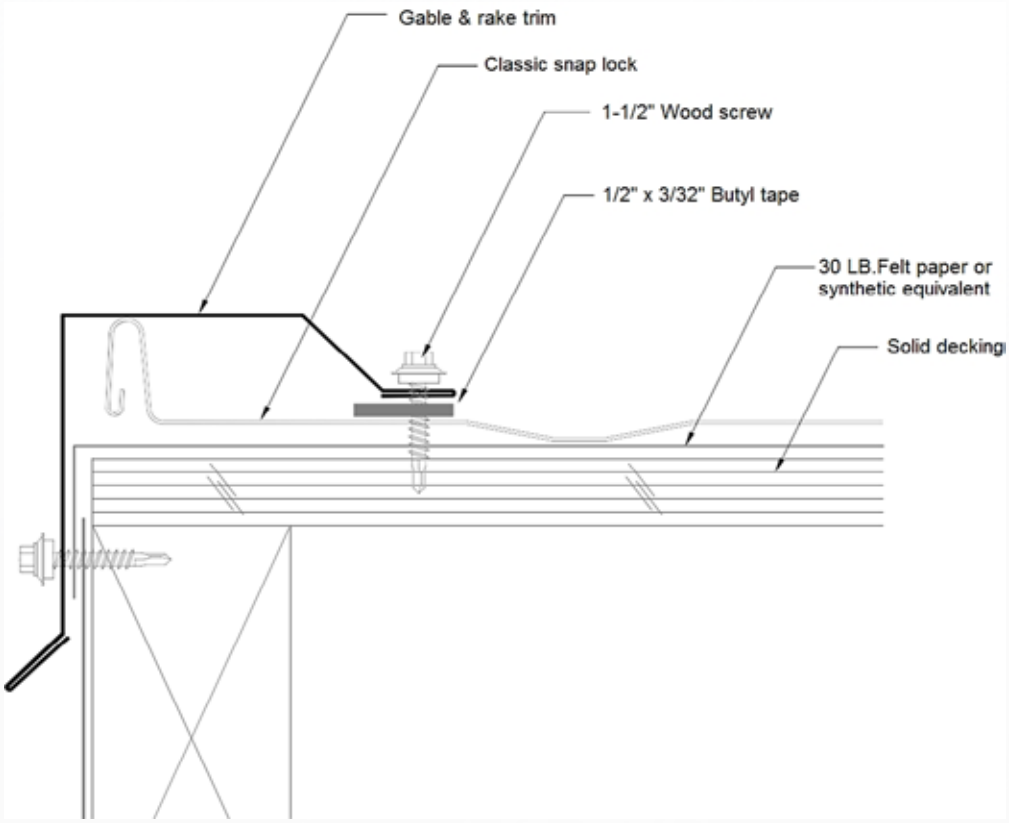
DIRECTION:

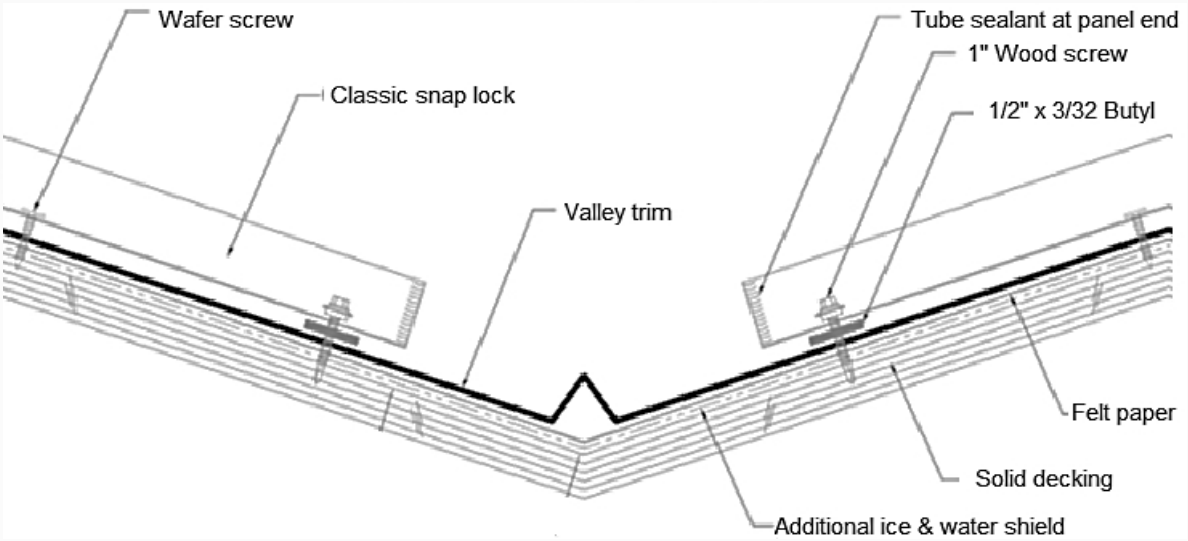
1. Begin by aligning Classic Snap Lock panel flush to the gable end of the building and attaching the flange side of the panel with pancake head screws.

2. Assemble the Rake Trim with # 10 x 1" washered screws as shown with screws 24" apart.

3. Pancake head screws should be placed 9" on center along the flange at flush depth.

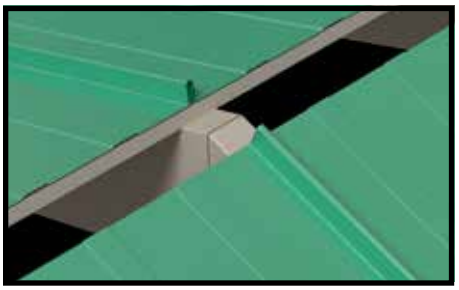
Be sure fastener heads are flush with the panel flange. DO NOT OVERDRIVE SCREWS AS IT WILL INCREASE OIL CANNING IN THE PANEL. DO NOT UNDER DRIVE SCREWS OR THEY WILL LEAVE BUMPS ON THE SNAP LOCK EDGE.



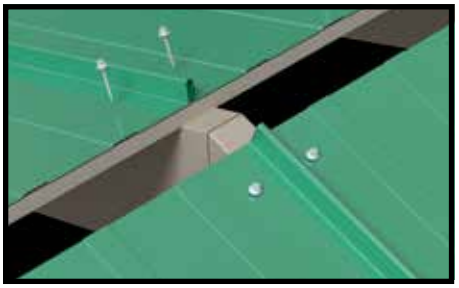


INSTALLATION INSTRUCTIONS

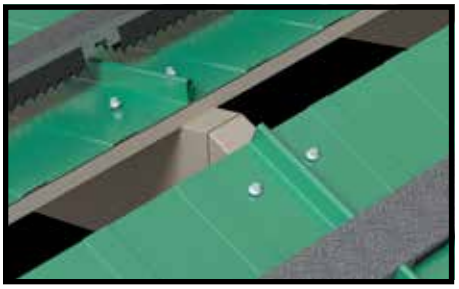
Universal Ridge Clip



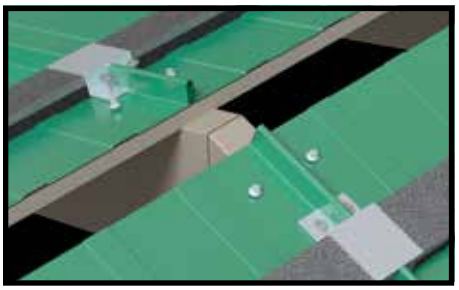
1. Allow a 2″ wide continuous opening at the ridge of the building.



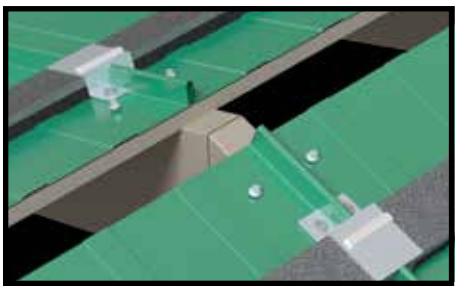
2. Fasten the top of the panel per the manufacturers recommendations.



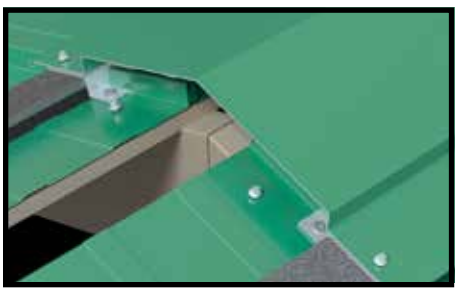
3. Position the closure on the panel so that the "down hill" edge will be covered by the ridge cap by ½″.



4. Fasten universal ridge clip to the panel with 1-1/4″ × #10 screws.



5. Caulk where clip meets the seam and on fastening area of clip.



6. Fasten ridge cap to each universal ridge clip. The self drilling screws should be per manufacturers recommendations. (Fasteners are not provided.)

ST Fastening systems

Putting the Clamps on Snow

Bend Your Own Rail From Your Color Matched Roof Material

ST FASTENING SYSTEMS introduces a functional but aesthetic way to prevent snow & ice dams from building up on standing seam metal roofs. The MRC SNOW TRAX incorporates a roof clamp & rail system that is easy to install & blends well into the color scheme of the roof panel. The panel manufacturer will form the rail from trim stock & slide it through the clamp to complete the system. It is functional & cost effective.

The extruded aluminum clamp & painted 26 gauge metal rail combine to form the MRC SNOW TRAX system

SnowTrax™ ***Available For Exposed Fastener Metal Panels***

304 Stainless Steel snow guard is available in 28 powder coated industry standard colors. Use with the WOODBINDER MB micro-bit for a secure attachment to metal roof panels.

FEATURES AND BENEFITS

- Made in USA
- Colored rail bent out of customer inventory
- Freight savings
- Efficient inventory management
- Product testing independently verified
- 25 Year Warranty

The MRC SNOW TRAX standing seam roof clamp system has been designed to provide the highest degree of safety.

The extruded aluminum clamp is attached to the roof panel rib by tightening two 5/32" stainless steel cone set screws. They should be set at 70-90 inch pounds of torque. The cone shape of the point will not penetrate the seam. This will ensure the weather tightness & protect the finish on the roof panel. The clamp & rail system is designed to provide excellent holding strength.

The 25 year written warranty ensures that the MRC SNOW TRAX is free of material defects, & will provide a safe & maintenance free snow retention system.

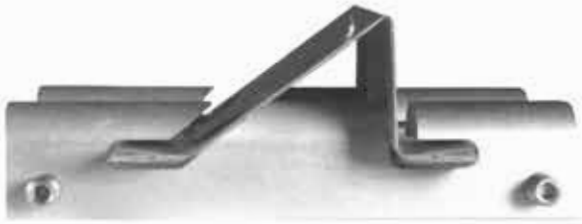

TABLE 1 - TEST RESULTS FOR MRC SNOW TRAX	
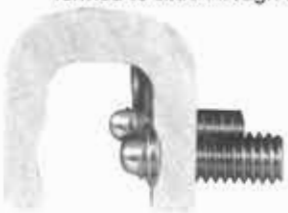
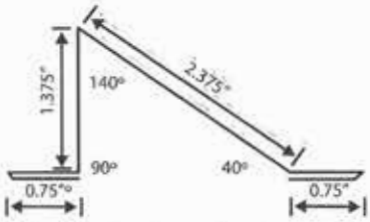
Ultimate Axial Load Capacity - 26 gauge steel roof panel	913 lbf [S.D. 46.6 lbf]
Ultimate Axial Load Capacity - 24 gauge steel roof panel	843 lbf [S.D. 67.4 lbf]
Ultimate Axial Load Capacity - All Samples	878 lbf [S.D. 64.7 lbf]

MRC SnowTrax™

The Extruded Aluminum alloy clamp is machined with pre-drilled holes. 26 gauge colored rail is formed to slide through the grooves in the clamp.

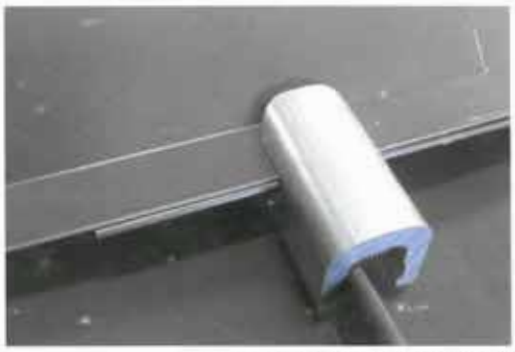


304 Stainless Steel coned set screws are provided to secure the clamp to the standing seam roof panel.



The schematic drawing below illustrates the dimensions to fabricate the rail from the same material as the roof.

APPLICATIONS



The MRC SNOW TRAX is shown installed with the colored rail.

The MRC SNOW TRAX is both functional & attractive. The colored rail blends into the overall look of the roof panel.
